USB input

5V protection

The 0.2A polyfuse prevents the regular +5V rail to draw excessive current via the USB cable in case the user forgets to remove the jumper.

USB only powers the +5VL rail, which in turn powers the 3.3V rail

CAN

Main Input Terminal, pluggable

Black:
LCSC C2938680 + C2938681 (Dorabo
DB2ERC-3.81-4P-BK /
DB2EK-3.81-4P-BK-S)

Green:
TME 15EDGRC3.81-04P +
15EDGK3.81-04P

Thermistor TH0

Thermistor TH4

Thermistor TH8

Thermistor TH1

Thermistor TH5

The input resistors are specified as 1206 to allow for enough power dissipation in case of an overload.

The BAT54S diode in conjunction with the 2 resistors are used for overload protection.

Previously tested was BAV99, however, it pulls the 3.3V to a bit over 4V via the STM32's input protection pins.

Using a BAT54S only results in 3.6V, which is still within limits of V_{apc} and V_{dda}.

Thermistor TH2

Thermistor TH6

Thermistor TH3

Thermistor TH7
